

LBNC_o

These instructions explain how to connect your Leaptel router to the LBNC_os Network. Please contact support if you have any questions, our contact details are on the back page.

1. To connect on with LBNC_o you will need to identify if your LBNC_o ONU is located outside on an external wall or is located inside your home. If the LBNC_o ONU is located outside there will be internal data ports where you connect your Netcomm modem. If your ONU is located inside you can either connect direct to it or use internal data ports if installed.
2. Unpack your supplied Netcomm Router and connect the power near the LBNC_o ONU and turn it on.
3. Run the supplied yellow network cable from the blue WAN port on the Netcomm Router to the wall socket or the Lan1 socket on the LBNC_o ONU.

5. You should now see the WAN light located on the front of the router is now green.
6. After 60 seconds the internet light should also come on.

4. Turn your modem on by pressing the On/Off button located on the side of the modem.

7. You are now online and able to connect to the internet.
 - a) If you wish to connect via wireless, look on the bottom of your modem for your wireless details and use the credentials supplied to connect your computer up. Your wireless details are also provided on a card in the box with your modem. For further information on how to do this please consult your devices documentation or the Leaptel website
 - b) If you wish to connect via ethernet cable, you need to plug your cables into the yellow ethernet ports between your computer and the modem. Some homes have had ethernet cable run which can be used for this purpose. Please talk to your electrician or builder for further information.
